## Abstract Multidimensional STIMULUS SPACE

## NEUROFEEDBACK: KL-Evidence Model & Training

if two shapes become more similar neurally, they may be perceived similarly  
Drive neural activity for shapes near category boundary towards category prototypes

## Hypothesis

Reinforcing differential neural activity patterns in ventral temporal cortex for visually similar shapes will drive apart their neural representations and reduce perceptual similarity

trial-level fast timescale access neural pattern change neural representation

## real-time fMRI neurofeedback below threshold of awareness

no explicit top-down learning signal

## Experimental Design

## Inducing and Measuring PERCEPTUAL CHANGES

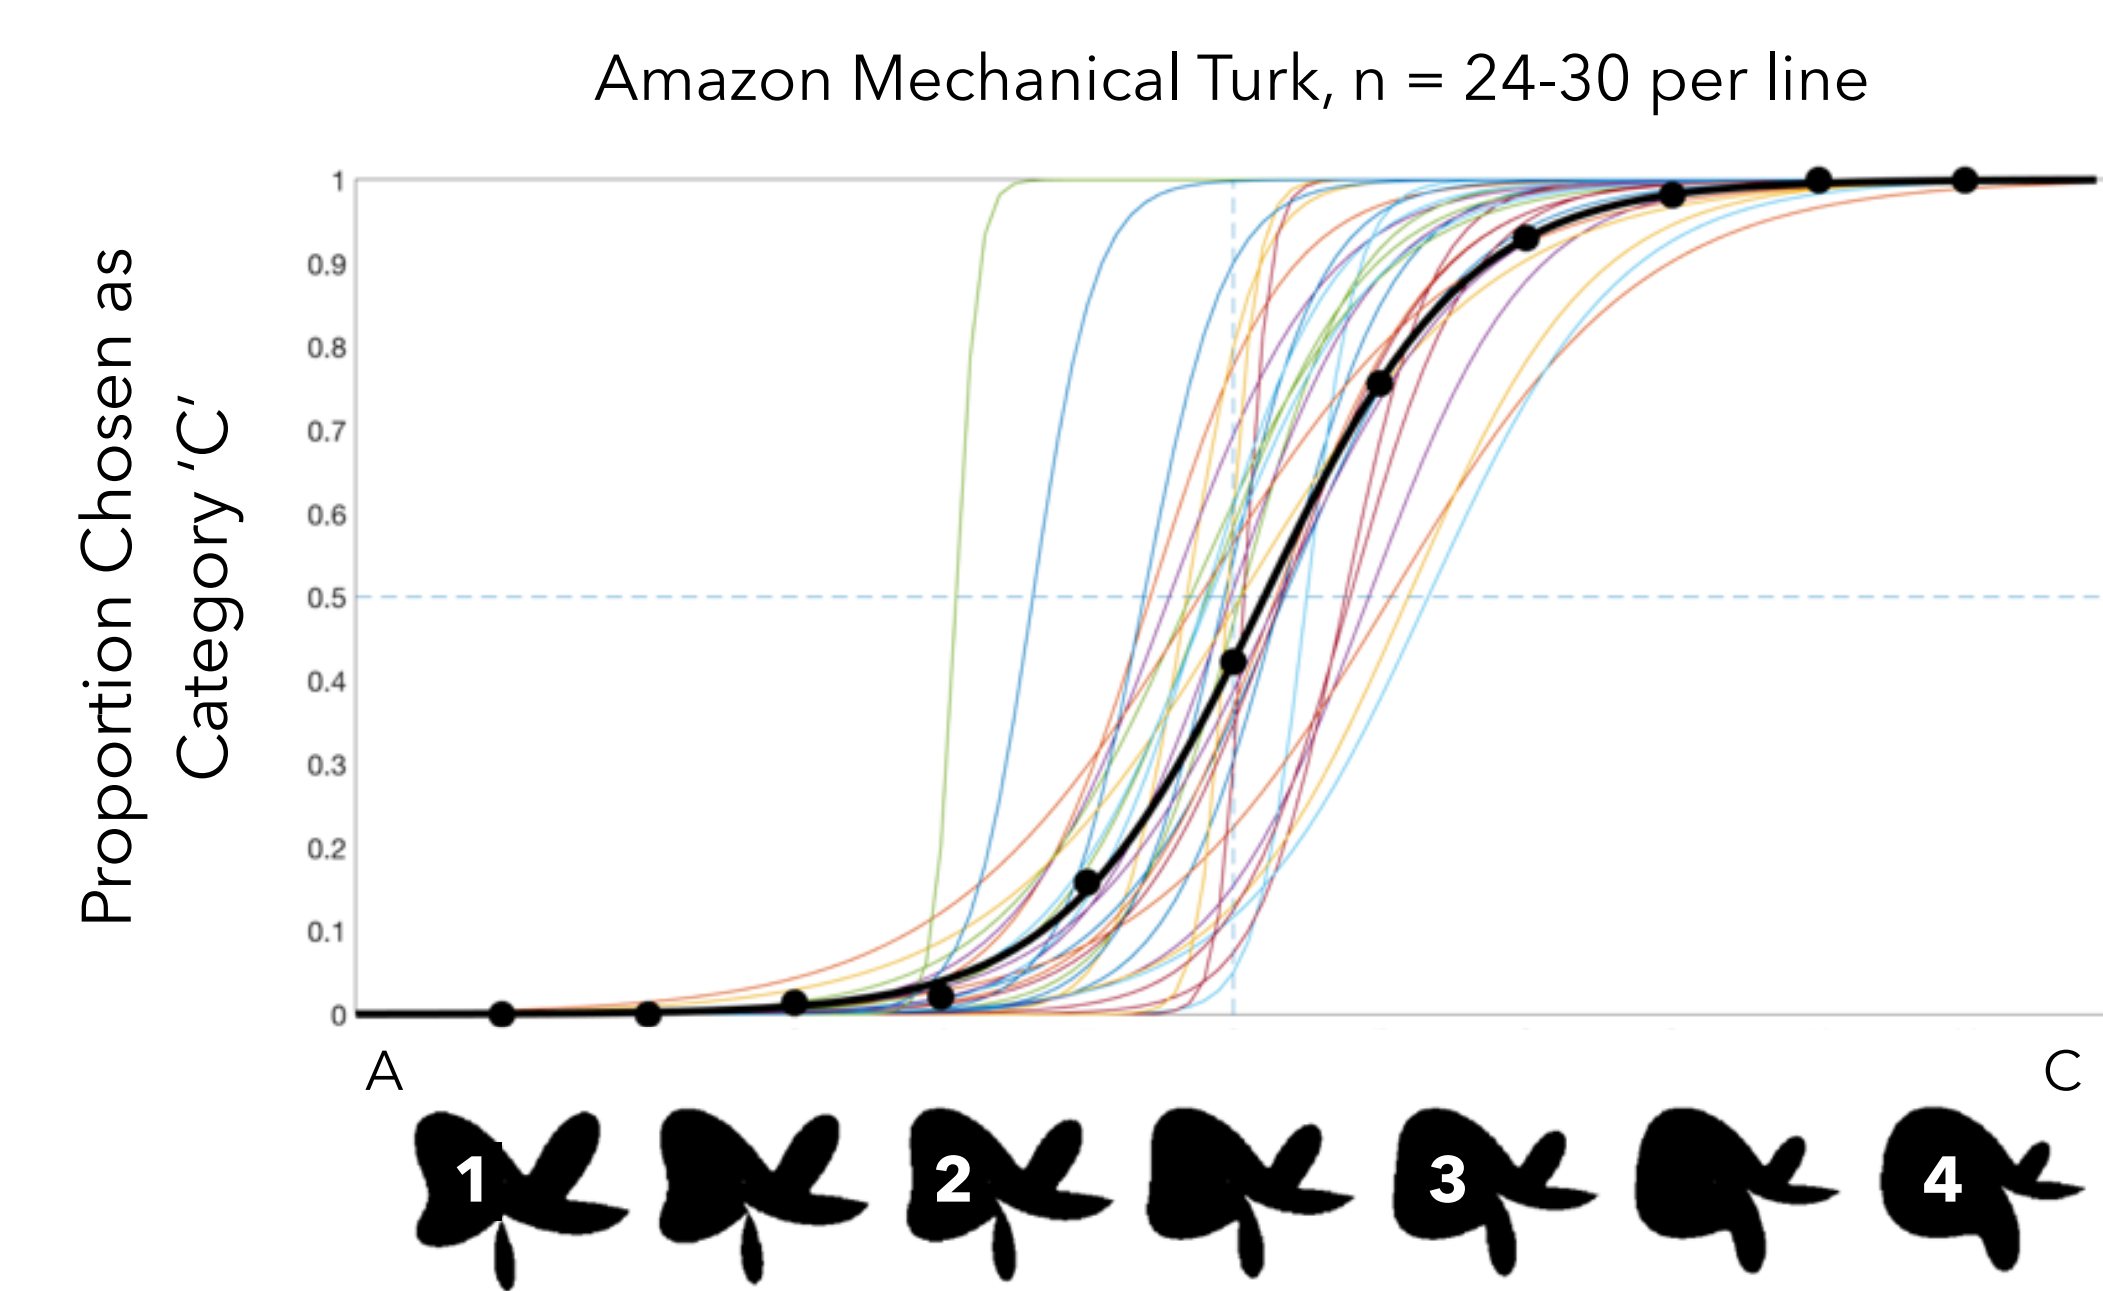

### Categorical Perception of Space

2AFC between line endpoints | 10 lines

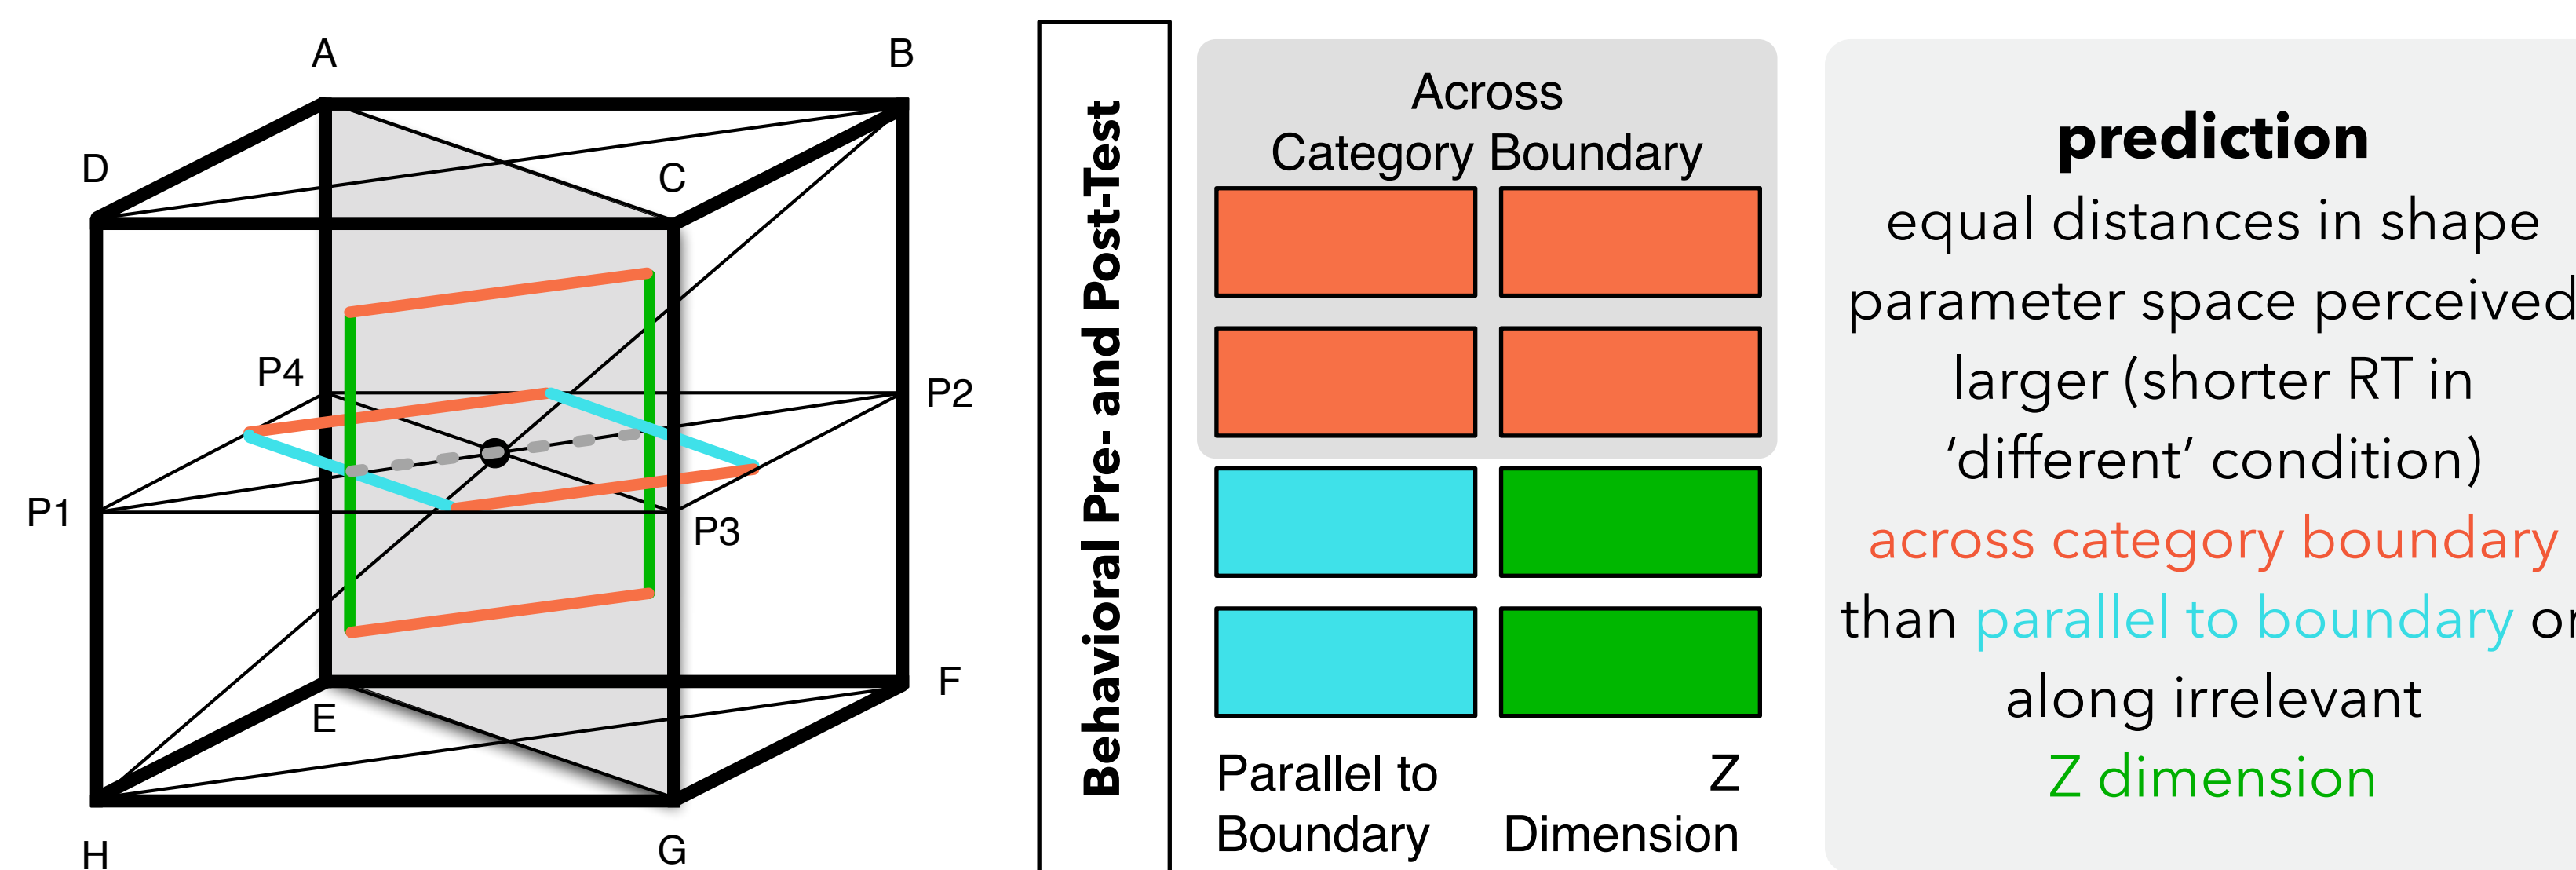

prediction sharper category boundaries (steeper psychometric function) for feedback dimension versus untrained dimensions

center of space perceived equidistant from endpoints across all dimensions

Behavioral Pre- and Post-Test	Across Boundary	Along Boundary
	DB	AC
P1P2	P4P3	
HF	EG	
AE	BF	
CG	DH	
	Z Dimension	

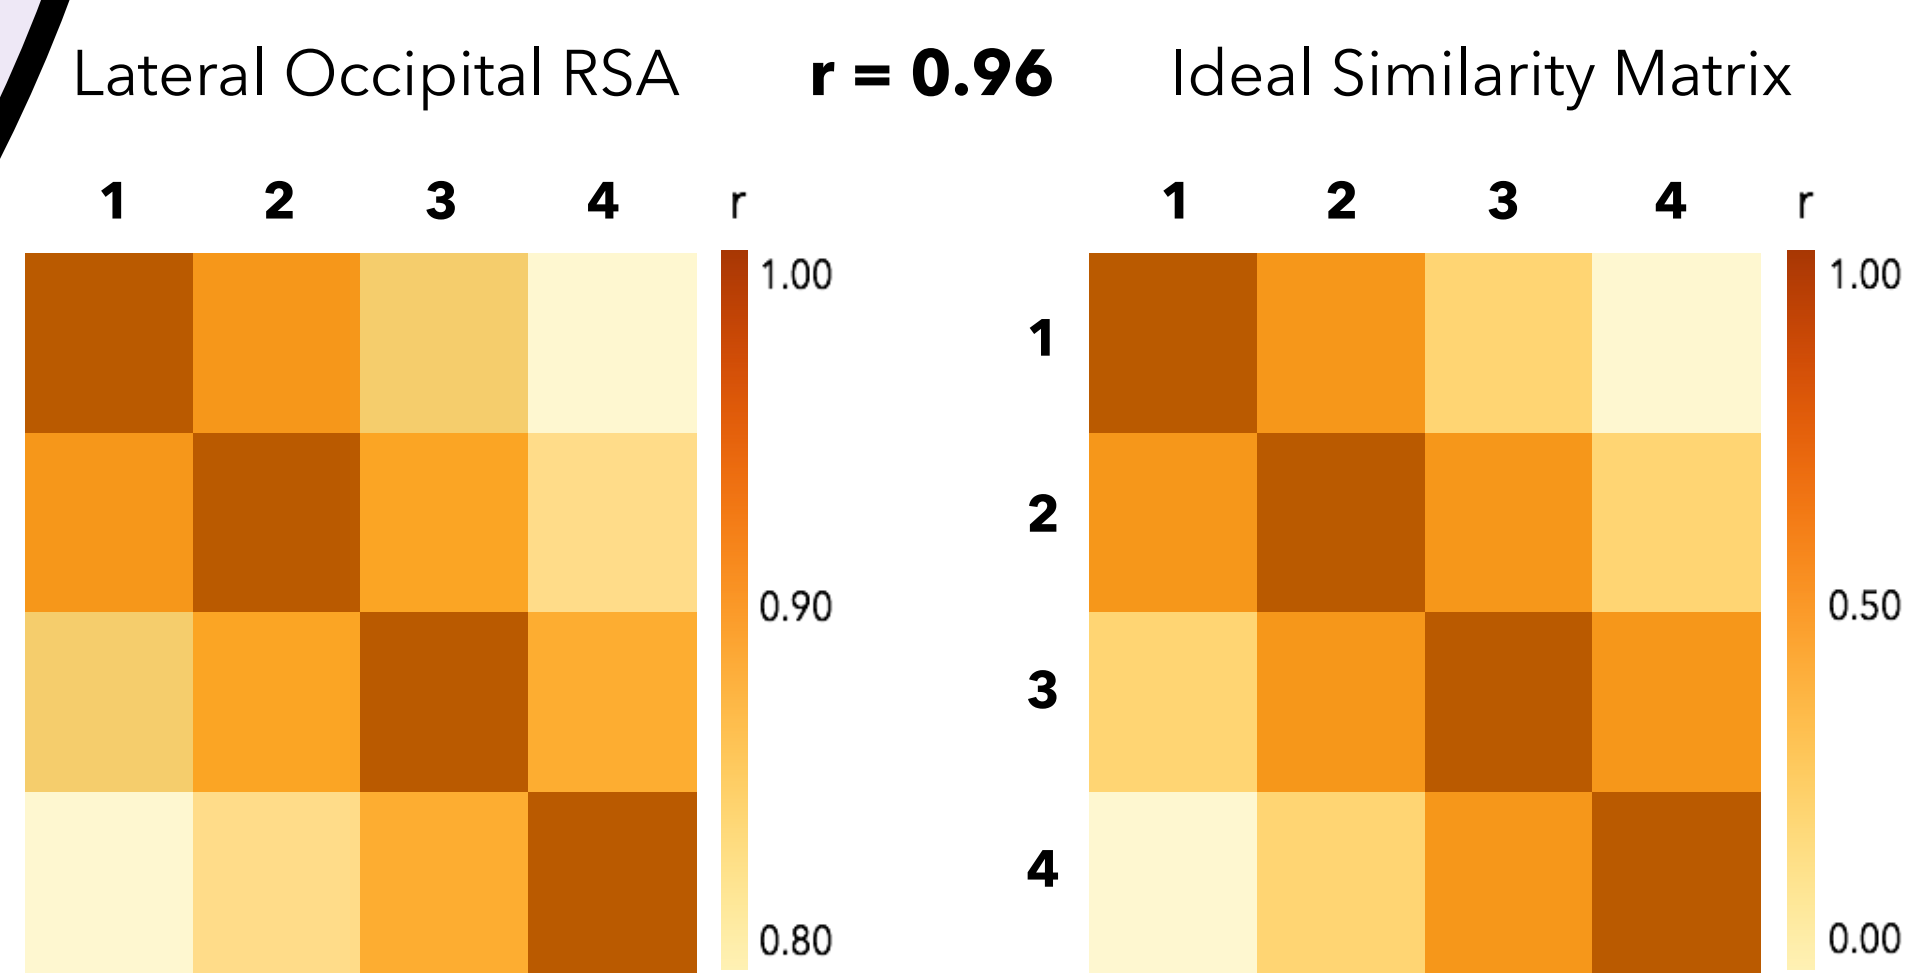

## Perceived Distances Across Dimensions RTs for same-different task

## NEURAL REPRESENTATION of Shape Space

### Parametric Shape Localizer

average 6 lines | n=8 | anatomical ROI

## Feedback Training ROI Searchlight for parametric regions: r > 0.50

## Category Prototype Classification: P1 vs. P2 n=1 | 10 runs
